## Intra-uterine Insemination

IUI is a process which involves placing the sperm into the women's uterus to facilitate fertilisation.

IUI is a fertility treatment used in couples with conditions such as unexplained infertility, abnormal sperm count or mobility, cervical mucus problem or ejaculation dysfunction. IUI gives the sperm an advantage by providing a head start: however the sperm has to reach and fertilise the egg on its own.

IUI can be performed in a natural cycle or with ovulation induction.
